TITLE:

On the Motion of a Tenacious Liquid on a Rotating Sphere
(O dvizhenii vyazkoy zhidkosti na vrashchayushchemya share)

PERIODICAL: Izvestiya Akademii nauk Uzbekskoy SSR, Seriya fiziko-matematicheskikh nauk, 1959, Nr 2, pp 38-46 (USSR)

ABSTRACT:

The author considers a rigid sphere, the surface of which is covered with a layer of an incompressible liquid. The sphere rotates with a constant angular velocity around a diameter. At the surface of the liquid there act tangential stresses which are symmetrical to the axis of rotation and direct in the direction of the parallel. For the problem formulated in this manner the author determines the components of the vector of velocity of the liquid in the stationary process. The solution is obtained from linearized motion equations. The discussion of the solution yields: The whole liquid layer decomposes into 6 torus-shaped regions, the common axis of which is the spherical diameter and which are arranged symmetrically to the equatorial

TITLE: Raising the Yield of Metal by Using Hot Ingot Tops (*Povysheniye vykhoda godnogo putem obogreva pribyl'noy chasti slitka*)

PERIODICAL: 'Stal', 1957, no.7, pp. 587 - 592 (USSR)

ABSTRACT: Investigations carried out on the "Serp i Molot" Works on heating hot top of ingots of killed steel and riser for large steel castings are described. The following participated in the work: Engineers C.V. Sviridov, V.M. Maksimov, P.I. Mel'nikov, A.V. Rabichev, V.I. Tvirov, I.I. Fomin, A.I. Filatova and laboratory assistants I.P. Zabotkin, I.D. Ob'edkov and others. The usual works' practice was to team 75-ton open hearth heats into 84 to 90 moulds (0.8 ton). Bottom pouring of ingots placed on 12 ingot stools with filling sinkheads with bunkerite was used. Cropped head for carbon steel was 13 - 13.5% and for some low alloy steels 15-16%. Ingot dimensions: top 330 x 330 mm, bottom 275 x 275 mm, height 1 085 mm. The use of the following substances for heating hot tops was tested: 75% ferro-silicon (crushed to -2 mm) 5 - 6 kg per ingot with a supply of oxygen (2 - 3 min) and 6 mixtures of ferro-silicon, aluminium, sodium nitrate, chamotte powder and silico-calcium in various proportions and combinations. The composition of mixtures numbered Cardl/3tions and combinations. The composition of mixtures numbered

133-7-5/28

Raising the Yield of Metal by Using Hot Ingot Tops.

1 - 6 is given. The structure of the ingot with heating top with ferro-silicon is shown in Fig.1, methods of sampling ingots in Fig.2, comparison of macrostructure of longitudinal templets of ingots (Al2 steel) with heating sinkhead with lunkerite and mixture 5 in Fig.3. Gas content in various parts of an ingot cast with intensive heating of the sinkhead and chemical composition of samples from longitudinal templets of ingots heated with lunkerite and mixture 15 are given in Tables 1 and 2, respectively. As the next step in saving metal, the shape of sinkhead was modified (Fig.4) and the insulation of hot tops improved (Fig.5). It is concluded that the use of intensive heating of hot tops of large ingots and large shaped castings by combustion of 75% ferro-silicon in a stream of oxygen improves the quality of ingots and castings and gives an economy of metal from 4 to 15%. The method of heating hot tops of ingots not larger than 1 ton using mixture No.5, (70% of 75% ferro-silicon, 20% of sodium nitrate, 10% chamotte powder) for ingots stripped with clamps and mixture No.6 (70% of 75% ferro-silicon, 20% sodium nitrate and 10% silico-calcium) for ingots and medium shaped casting for which clamps are not used, also improves the quality of ingots and castings and gives an economy of metal from Card2/32.5% for ingots to 15% for castings. Considering that the work

133-7-5/28

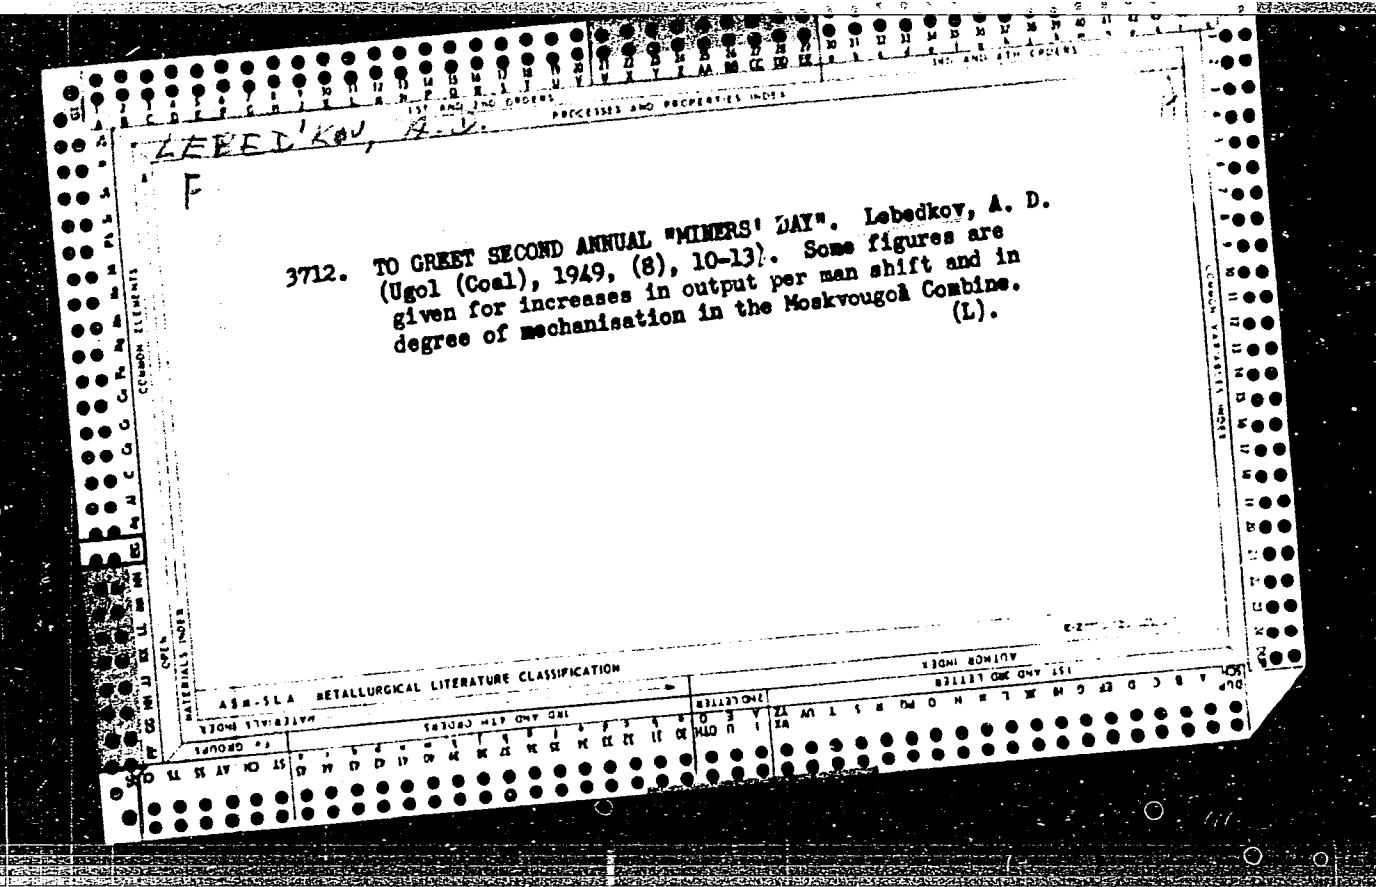

Raising the Yield of Metal by Using Hot Ingot Tops.

was carried out with 800 kg ingots, application of the above heating method for larger ingots should be additionally checked. During 9 months of operating according to the new practice crop ends were decreased by 2.3% and defects due to microstructure to 0.21% instead of the previous figure of 0.50%. There are 5 figures and 2 tables.

TITLE: An Investigation of the $\gamma \rightarrow \delta$ and $\delta \rightarrow \sigma$ Phase Transformations by Magnetic Analysis of Microstructure (Issledvoaniye fazovykh prevrashcheniy $\gamma \rightarrow \delta$ i $\delta \rightarrow \sigma$ magnitnym mikrostrukturnym metodom)

PERIODICAL: V sb.: Fiz.-khim. issled. austenitn. splavov. Moscow, Mashgiz, 1957, pp 75-86

ABSTRACT: Magnetic analysis of microstructure (magnetic particle inspection) was employed to study the conditions of formation of the δ phase and its connection with the σ phase in austenitic grade 19-9, 25-10, 18-8-5, and 20-10-3 Cr-Ni steels. It was established that the temperature of formation of the δ phase is not identical in the various steels, as resistance to formation of the δ phase increases with diminishing Cr:Ni ratio. The rate of formation of the δ phase is significantly dependent upon the holding time in hardening. The σ phase is an intermetallic compound with a tetragonal lattice. The rate of formation of the σ phase in the δ phase is signifi-

Card 1/2

137-58-2-3937

An Investigation of the (cont.)

cantly dependent upon the rate of diffusion of Cr in the δ phase. The rate of transition of $\delta \rightarrow \sigma$ at first is very rapid, but then it slows down, so that even for exceedingly long holding periods (up to 6000 hours), the δ phase does not completely transform into the σ phase. Measurements of micro-hardness have shown that formation of the σ phase induces a considerable increase in brittleness. The phase composition of the steel was monitored by x-ray analysis of the structure and by chemical etching. It is shown that magnetic determination of the microstructure is less complex than x-ray and metallographic methods.

TITLE: Phase Transformations in Austenitic Steels During Plastic Deformation (Fazovyye prevrashcheniya v austenitnykh stalyakh, proizkhodyashchiye pri plasticheskoy deformatsii)

PERIODICAL: V sb.: Fiz.-khim. issled. austenit. splavov. Moscow, Mashgiz, 1957, pp 91-106

ABSTRACT: Magnetic microanalysis was employed to investigate phase transformation occurring during cold plastic deformation in the following austenitic steels: EI505, 1Kh19N9T, EI434, 4Kh74N14V2M, 19-9, EM405, EI407, Kh18N11B, 16-33-3, EI388. It is shown that softening occurring on deformation facilitates the $\gamma \rightarrow \alpha_2$ transition. Phase stresses are particularly great in the case of precipitation of the α_2 phase along the boundaries of highly deformed grains. The process of slip is accompanied by lattice distortion, and shear stress results in viscous slip along the grain boundaries. Decomposition of γ with formation of α_2 on the grain boundaries occurs only in instances of slow deformation. In the event of signifi-

Card 1/2

137-58-2-3939

Phase Transformations in Austenitic Steels During Plastic (cont.)

tant deformation, the $\gamma \rightarrow \alpha_2$ transition appears along the boundaries of twins. The rate of transition increases rapidly as temperature drops, and precipitation of the α_2 phase results in hardening. The $\gamma \rightarrow \alpha_2$ transition is reversible. The temperature interval of reversible transition is below the temperature of crystallization. Ni, Cr, Mn, Mo, and C stimulate formation of an α_2 phase to different degrees. The solid γ -solution becomes less stable on precipitation of a carbide phase $(\text{Me}, \text{Cr})_{23}\text{C}_6$ during aging. Metallographic and x-ray analysis of structure yielded concordant results.

TITLE: Phase Transformations in EI572 Steel During Forging (Fazo-vyye izmeneniya v stali EI572 pri kovke)

PERIODICAL: V sb.: Fiz.-khim. issled. austenit. splavov. Moscow, Mashgiz, 1957, pp 137-159

ABSTRACT: The changes in the phase composition of EI572 austenitic steel (19% Cr, 9% Ni, 0.26-0.36% C) were investigated with the object of determining optimum conditions for heating and cooling after forging. The processes of formation and change in δ ferrite, ferrite in the vicinity of the carbide phase, and ferrite arising as a result of plastic deformation, were also studied. Separation of the carbide phases was performed by making use of the selective solubility of carbides of the $Mo_{23}C_6$ type in hot HCl. The type of carbide was determined by x-ray structural analysis. Ferromagnetic phases were identified by magnetic analysis of the microstructure. It was shown that δ ferrite develops as a result of nonhomogeneous dendritic crystallization; its amount may be reduced by homo-

Card 1/2

137-58-2-3943

Phase Transformations in EI572 Steel During Forging

generation at 1250°. To avoid formation of δ ferrite, the final stage of heating and forging of the bars should be conducted at a temperature \leq 1150°. The major ferrite formers are C, Cr, Mo, and Ti. The maximum amount of metastable α' ferrite is formed on slow cooling to 850° and depends upon the rate of diffusion of the alloying elements around the carbide inclusions. The change in the structure of the steel in the process of aging at 650° is attributable to the formation and growth of carbides of the $Mo_{23}C_6$ type. EI572 steel becomes less stable in the course of the aging process and acquires a tendency to formation of α' ferrite. Aging of the steel consists of the precipitation of a carbide phase $(Nb, Ti)C$ and $(Cr, Ni, Fe, Mo, W)_{23}C_6$, and sometimes due to formation of a σ phase of the $(Cr, Mo)Fe$ type.

TITLE:

The Problem of Water Inflow into New Pits of the Podmoskov'ye Coal Basin (K voprosu opredeleniya pritoka vody v novyye shakhty Podmoskovnogo ugol'nogo basseyna)

PERIODICAL:

Razvedka i Okhrana Nedr, 1958, Nr 2, pp 47-52 (USSR)

ABSTRACT:

A preliminary calculation of the magnitude of water inflow in new pits in the Podmoskov'ye coal basin determined the number and the capacity of pumps to be installed, reservoirs to be prepared, and the costs of all necessary installations. These incorrect calculations will cause much extra expense. The authors propose some changes in the formulae used for such calculations (devised by S.V. Troyanskiy). These changes are described in detail. There are 2 graphs and 3 tables.

AUTHOR: Lebekhov, P.I., Lieutenant-Colonel of the Medical Corps

TITLE: On Burns of the Cornea in Experimental Radiation Disease
(Ob ozhogakh rogovoy obolochki pri eksperimental'noy
luchevoy bolezni)

PERIODICAL: Voyenno-meditsinskiy zhurnal, 1958, Nr 4, pp 12-15 (USSR)

ABSTRACT: This article deals with investigating burn processes in the tissues of the eye in radiation diseases of different degrees. Experiments on 41 rabbits were carried out with the aid of a device, designed according to the principles of A.A. Smolyanov's thermoesthesia-meter [Ref. 1]. About 2-3 days after radiation, most of the animals reacted with noticeable clinical appearances, such as adynamia, diarrhea, leukopenia, lymphopenia and food refusal accompanied by a loss in weight. Immediately after the eye had been burnt, and during the following days, the same changes in the eyes of radiated

Card 1/2

SOV/177-58-4-3/32

On Burns of the Cornea in Experimental Radiation Disease

and control animals were observed. Two days later, epithelialization started from the edges of the cornea defect and finished after 12 days, completely covering the defect. A secondary infection sharply changed the course of the burn process in both the radiated and the control animals. Based on his experiments, the author concluded that second-degree thermal burns of the cornea are frequently accompanied by a more serious secondary infection than in usual burns. In moderately-pronounced radiation disease, an infection in the burn's focus was as frequently observed as in control animals. In animals suffering from a first degree radiation disease, the involution of inflamed changes and the regeneration of the epithelium progressed even quicker than in control rabbits. There is 1 Soviet reference.

Title : The Raising of Down Wool Goats and Ways for Its Improvement

Orig Pub : Ovtsevodstvo, 1957, No. 8, 17-20

Abstract : The world's two best breeds of down wool goats, the Don and Orenburg breeds, are being raised in the USSR. The Don goats are characterized by a high production of down wool averaging 0.6 kg.), but have a somewhat coarser down wool than that of the Orenburg goats. Good results were obtained by the crossing of the Don bucks with the Kirghiz and Corno-Altai female goats. The most valuable Orenburg goats are found in the Chkalov Oblast'. The down wool yield of bucks is 0.3 kg. and that of the female goats 0.22 kg. The crossing of the Don bucks with the Orenburg female goats

Abs Jour : Ref Zhur - Biol., No 10, 1958, No 45226

Abstract : brings about the increase of the down wool production but at the same time makes the down wool coarse. Such crossings are recommended only in regard to the female goats of the lower class. The new breed groups of the White and Grey down wool goats are being developed in the Uzbek SSR by the crossbreeding of the local female goats with the Angora bucks. It is recommended to make wider use of the crossing of the coarse-wool and demi-down wool female goats with the Don bucks.

TITLE: A copy-miller for machining turbine vanes. Class 49, No. 174498

SOURCE: Byulleten' izobreteniy i tovarnykh znakov, no. 17, 1965, 110

TOPIC TAGS: milling machine, turbine blade

ABSTRACT: This Author's Certificate introduces a copy-miller for machining turbine vanes. The milling heads are mounted on both sides of the workpiece and move in the transverse direction with respect to the table which carries the workpiece. The forces which twist the vane during machining are reduced by equipping the miller with a hydraulic servosystem which has pickups based on slide valves. The valves direct the stream of working fluid to the activating mechanism which rotates the pieces being machined and the master copy in such a way that the surface of the master copy in contact with the feelers will be normal to the line passing through the centers of curvature of the feelers for the copy pickups. The surface of the part being machined is turned so that it is normal to the line connecting the centers of the milling cutters.
